To overcome the inconsistencies of the historic IGS products due to modelling and reference frame changes the IGS initiated a reprocessing project. The goal of this project is the generation of a consistent and homogeneous set of IGS products starting with 1 January 1994. This contribution will discuss the type and temporal resolution of the reprocessed products. To generate a consistent set of reprocessed IGS products a number of common standards should be fulfilled by the analysis centers participating in the IGS reprocessing effort. Some of these issues have already been discussed and a consensus has been reached which will be summarized in this contribution.
