Abstract

ESOC/ESA continues to improve, maintain and expand its worldwide network of GNSS stations for the benefit of the international community through participation in the IGS and the EUREF, plus internal ESA efforts to enhance the data coverage worldwide.

In recent years new station deployments have taken place to strengthen the ESA/ESOC station network for internal project use. In October 2016 a new ESOC station has been installed in Bishkek (see insert below), and contacts are well underway for new stations in South Africa, Brazil, Russia, and Canada. All ESOC stations provide multi-GNSS 15min, Hourly and Daily Rinex 2.11 and Rinex 3 files, as well as GPS CA NBS (NavBits) files.

ESOC Station Network

The station network map below shows the ESA GNSS station network, which currently comprises 18 stations. A total of 10 stations are deployed at ESA ESTRACK core/cooperation locations; Kourou (KOUR), Redu (REDU), Malacami (MAS1), Cebrenos (CEBR), Villarance (VILL), Kiruna (KIRU), Malargue (MGUI), New Norcia (NNOR), Malindi (MAL2) and Santa Maria (SNTM).

In addition, two stations are deployed at ESA/ESOC’s premises in Darmstadt (ESOC and ESOB) connected to ultra-stable H-masers. Finally, 6 stations are deployed at third party sites; Awarua (AWAR), Banting (BANT), Bishkek (BSHK), Dubai (DUBA), Tahiti (FAA1) and Tsukuba (TSBA).

Over 2016 and the first half of 2017, all stations displayed data availability figures close to 100%. The data’s arrival is monitored every 15 minutes and it is processed in the ESOC IGS processing (Utras, Raptids and Finals) allowing for data quality and clock stability to be monitored. The ESOC stations also stream data in real-time in support of the IGS Real-Time Pilot Project.

ESOC Station Network Upgrade 2016-2017

ESOC is committed to provide worldwide data for all GNSS constellations during this year as a result of having completed the upgrade of the equipment for the ‘legacy network’ in 2012-2013, as well as focusing on the establishment of collaborations with third parties in order to install new stations at various new locations if agreements can be reached with the corresponding organizations. As such, following the completion of the upgrade, new stations were deployed in 2014 (SNTM, AWAR), 2015 (BANT, DUBA, TSBA, ESOB, ESOC) and 2016 (BSHK).

The entire ESA GNSS network now operates Septentrio PolaRx4 receivers and either SEPCHOKE antennas (most sites) or Leica AR25 antennas (used only at MGUE, MAL2, MASI and FAA). The only exception is ESOB, which is located directly next to station ESOC, and operates a Javelin 3 Delta receiver and Trimble TMS7971 antenna.

The PolaRx4 Septentrio receivers installed provide all the expected measurements for the GNSS constellations as available: GPS, GLONASS, Galileo, QZSS, Compass, SBAS, EGNOS, etc. As of mid-2013, ESOC has been contributing with daily, hourly and high rate multi-GNSS Rinex data to the IGS network, plus continuing with the regular RINEX 2 submissions. Since the beginning of 2016, ESOC has been providing Rinex 3 files with the correct “long names”.

For the 2nd half of 2017 worldwide coverage is planned to be further enhanced with negotiations with third parties in South Africa and Brazil in an advanced stage. Negotiations for new stations in Russia and Canada are also on-going. The map above shows the intended locations for all the new ESOC stations.

New ESA/ESOC station in Bishkek - BSHK

The latest addition to the ESOC Station Network has its antenna monument located on the roof of the 4-story building that hosts the Central-Asian Institute for Applied geosciences (CAIAG), in the city center of Bishkek, Kyrgyz Republic. With the installation of a multi-GNSS Septentrio PolaRx4 receiver and Septentrio Chokering MC antenna, the station (BSHK) became fully operational on Oct 4th 2016, providing full coverage of the Central Asian region, as well as enhancing coverage in the Middle East and Southeast Asia.

The station is co-located on the same roof as the IGS station BJK0, with an identical monument design for both stations, which are approximately 2m apart. Clear horizon performance is excellent with only a limited number of treetops obstructing the view for very low elevations. Preventive measures against lightning strike are provided in the form of a lightning rod on the adjacent roof.

Conclusions

ESA/ESOC is fully engaged in supporting the modernization of GNSS data formats and data transfers through our involvement in the RINEX Working Group and the IGS Infrastructure Committee. ESOC remains involved and committed to support the Rinex 3 data format and to the new Multi Signal Message RTCM real-time format, and in the upgraded ESOC station network we look forward to provide the upgraded data formats as part of the MGEX and the Real-Time pilot project.

The ESA/ESOC Navigation Support Office is also committed to providing the highest quality GNSS data by maintaining, improving and expanding the existing station network with modern Septentrio receivers and antennas, providing measurements for all GNSS-constellations.

ESOC multi-GNSS data

The station network is permanently monitored to ensure the data return from each site is complete. In particular checking the “triple station coverage” for each active GNSS satellite in every 24 hour period to detect problems and weak coverage areas.

All GNSS Constellations are covered with at least three ESOC GNSS stations more than 90% of the time as seen in the plots below:
