

Code/Phase Bias Products at CNES/CLS Analysis Center (1/6) History

Short Historical part:

- Wide Lane Biases (WL) computations started end of 2009 in our group (for GPS)
→
- P1C1 biases taken since the beginning from CODE/AUIB solution
As *Sinex-Bias format* was not defined/available at that time we did deliver our WL biases in home-made format.
- GALILEO WL Biases start in 2018
- Others biases were not used until last year (05/2021) when we start delivering sinex-bias files compatible with our products.

GPS WL Biases (2000-2010), Loyer et al, 2012

Code/Phase Bias Products at CNES/CLS Analysis Center (2/6)

Integer clocks

Since the beginning we did focus on the « integer-phase-clocks » allowing to derive « easily » PPP-AR (or IPPP) processing.

The formalism and link with others ACs products has been described in 2020 in a paper by Simon Banville; our strategy correspond to the « strategy number 2 » of this paper or « integer clock strategy »: individual biases are related to differential biases according to the following matrix:

$$\begin{bmatrix} \overline{dt}^j \\ DCB_{C1W,C2W} \\ DCB_{C1W,C1C} \\ 0 \\ UPD_{WL} \\ b_{IF}^j \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 & -\alpha_{IF} & -\beta_{IF} \\ 0 & 1 & -1 & 0 & 0 & 0 \\ 0 & 1 & 0 & -1 & 0 & 0 \\ 0 & 0 & 0 & 0 & \alpha_{IF} & \beta_{IF} \\ 0 & -\alpha_{NL} & -\beta_{NL} & 0 & \alpha_{WL} & \beta_{WL} \\ 0 & -\alpha_{IF} & -\beta_{IF} & 0 & \alpha_{IF} & \beta_{IF} \end{bmatrix} \begin{bmatrix} dt^j - \Delta t \\ \overline{b}_{C1W}^j \\ \overline{b}_{C2W}^j \\ \overline{b}_{C1C}^j \\ \overline{b}_{L1}^j \\ \overline{b}_{L2}^j \end{bmatrix}$$

Code/Phase Bias Products at CNES/CLS Analysis Center (3/6) Strategy

GRG/GRM Strategy (since 05/2021) ; Same strategy applied for GPS and Galileo products :

Differential biases :

- WL Computed from raw observations (No PCO applied yet)
- Code/Phase iono-free biases computed from Code-Phase clocks (bjfs)
- DCB (C1W/C2W for GPS) computed from igs/igr ionospheric maps : similar to (*)

Observable Specific Biases (OSB) :

- Individual OSB computed according to the matrix of the previous slide and written in sinex-bias format.
- Today we deliver these OSB for the following observations (depend from constellation) :
 - * G: C1C C1W C2W L1W L2W
 - * E: C1C C1X C5Q C5X L1C L5Q L1X L5X

They can be used to correct the RINEX observations following the sinex bias convention:

$$\text{Observation(true)} = \text{Measurement(RINEX)} - \text{bias}$$

Code/Phase Bias Products at CNES/CLS Analysis Center (4/6) Comparisons (Examples)

Comparisons with others biases solutions only possible at the differential level.

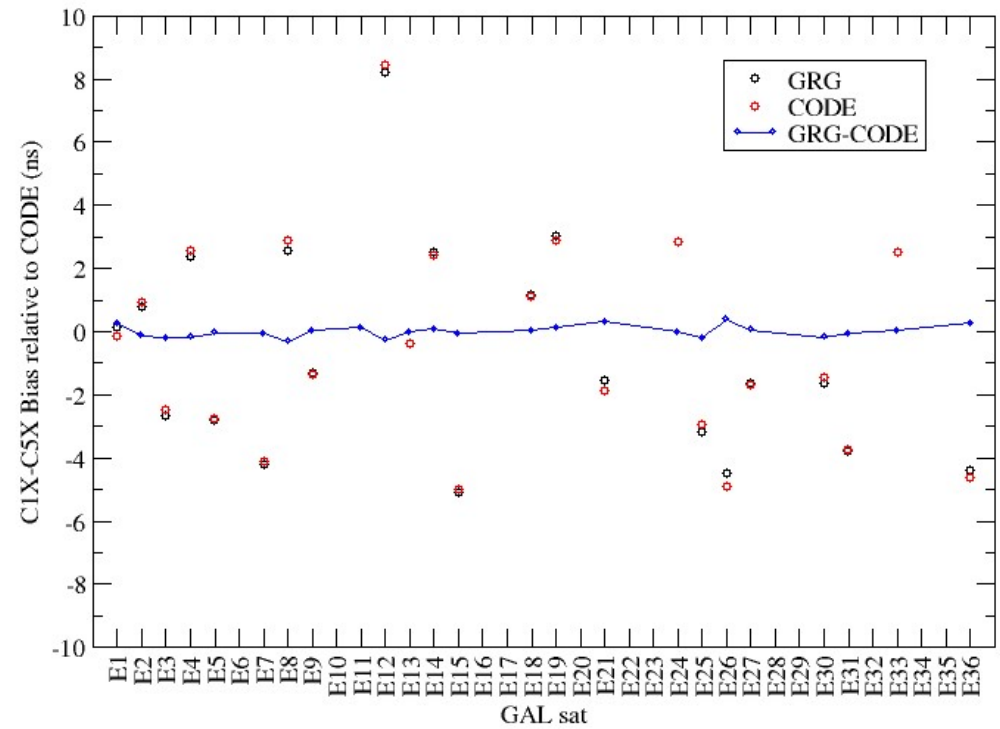

GPS

C1W-C2W Bias relative to CODE on 2021 033

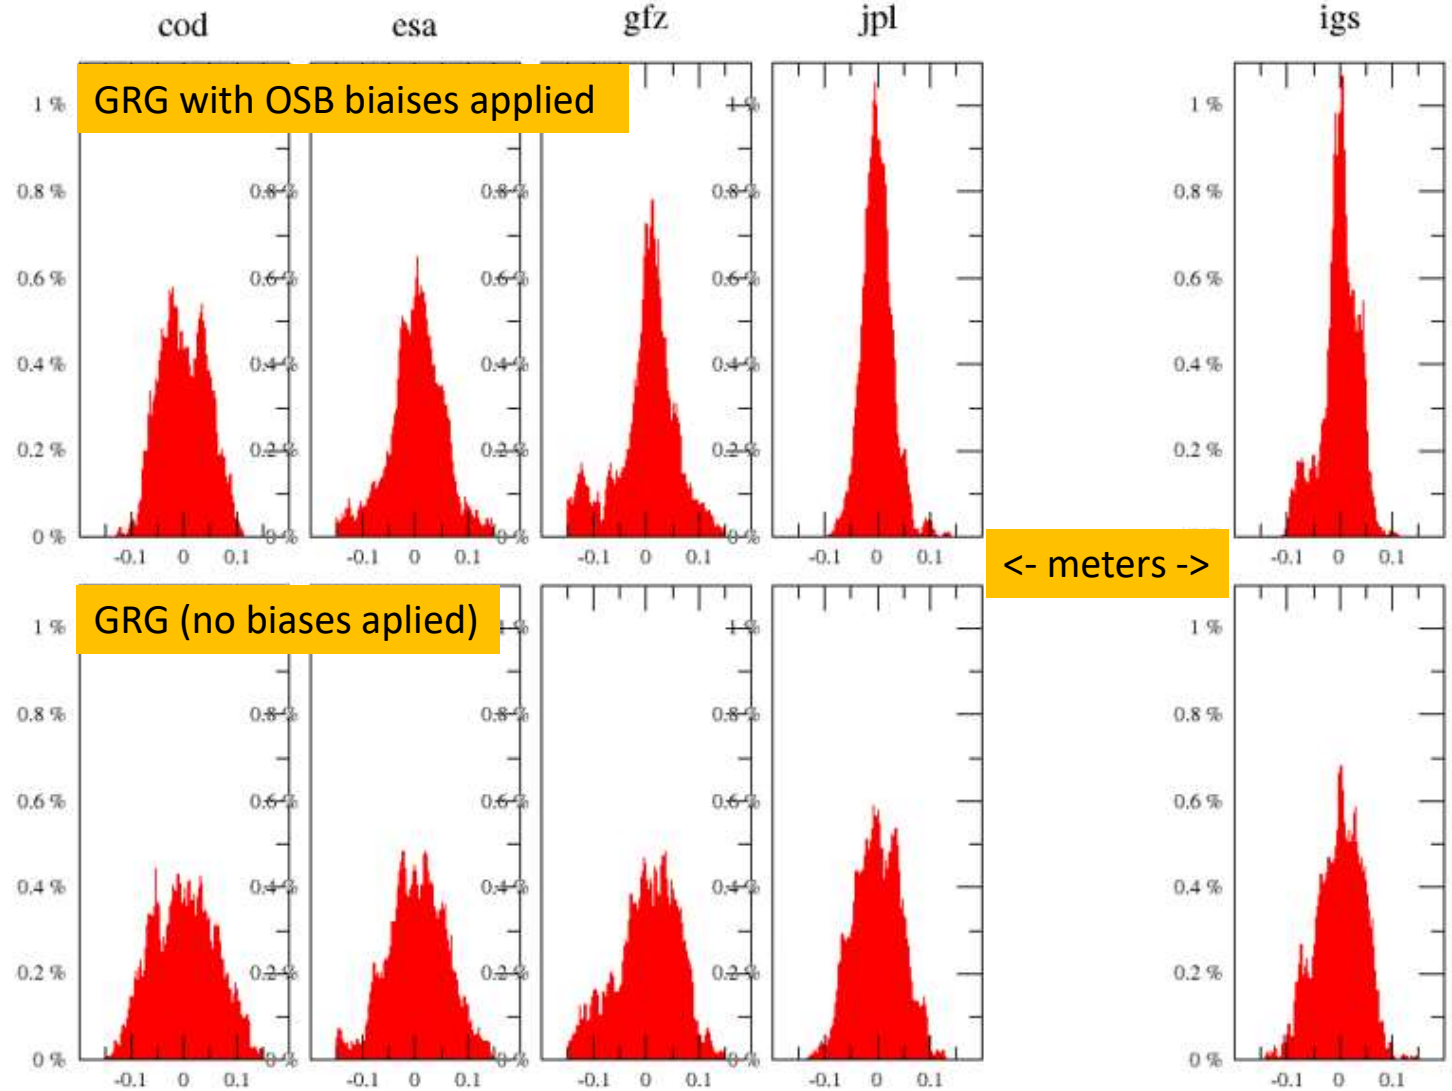

GALILEO

C1X-C5X Bias relative to CODE on 2021 033

Code/Phase Bias Products at CNES/CLS Analysis Center (5/6)

GPS clocks differences histograms between GRG and various solutions (~ 3 weeks doy 300-319/2021)

Code/Phase Bias Products at CNES/CLS Analysis Center (6/6)

Some Perspectives

Medium/Short term :

- Apply PCO of GNSS satellite before any processing
This will make differences for WL and DCB for those satellites having frequency-dependent PCO.
- Process Beidou observations and their biases (end of 2022)

Unknown term :

- Include more signals (e.g. L5 for modern GPS satellite)
- Upgrade softwares to process raw-signal (with OSB treated as measurements parameters)

Questions ?
